                                                                                                                                                                                                                                                                                                                                    Sequence 18, Application US/08547214
Patent No. 5871697
GENERAL INFORMATION:
APPLICANT: Rothberg, Jonathan
APPLICANT: Simpson, John
TITLE OF INVENTION: Classification of DNA Sequences in a Sample Without
TITLE OF INVENTION: Sequencing
NUMBER OF SEQUENCES: 59
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie and Edmonds
                                                                  Gaps

US-08-942-406-18
Sequence 10, Application US/08942406
Patent No. 6141657
GENERAL INFORMATION:
Simpson, John
TITLE OF INVENTION: Method for the Determination and NUMBER OF SEQUENCES: 59
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie and Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
STATE: New York
COUNTRY: USA
ZIP: 10036-2711
COMPUTER: READABLE PORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATION SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTI Release #1.0, Version #1.30
CURRENT APPLICATION NUMBER: US/08/942,406
FILING DATE: OL-CC-1997
CLASSIFICATION NUMBER: 08/547,214
FILING DATE: CUNKNOWN>
REGISTRATION NUMBER: 18,872
REGISTRATION NUMBER: 18,872
REGISTRATION NUMBER: 189.97

APPLICANT: Rothberg, Jonathan
APPLICANT: Deem, Michael
APPLICANT: Simpson, John
TITLE OF INVENTION: Method for the Determination and
TITLE OF INVENTION: Olassification of DNA Sequences in a Sample Without
TITLE OF INVENTION: Sequencing
NUMBER OF SEQUENCES: 59
CORRESPONDENCE ADDRESS:
ADDRESSE: Pennie and Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 70
US-09-313-221A-132/c
; Sequence 132, Application US/09313221A
; Patent No. 6468743
; GENERAL INFORMATION:
; APPLICANT: Thomas L. Romick (Inventor)
; TITLE OF INVENTION: PCR TECHNIQUES FOR DETECTING MICROBIAL
; TITLE OF INVENTION: POR TECHNIQUES FOR DETECTING MICROBIAL
; TITLE OF INVENTION: AND VIRAL CONTAMINANTS IN FOODSTUFFS
; TITLE OF INVENTION: AND VIRAL CONTAMINANTS IN FOODSTUFFS
; TITLE OF INVENTION: DATE: 1999-05-17
; PRIOR PELLING DATE: 1999-05-18
; SOFTWARE: FESTERE 1 1998-05-18
; NUMBER OF SEQ ID NOS: 145
; SOFTWARE: FastESEQ for Windows Version 4.0
; SEQ ID NO 132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Indels

Application US/09281418

Sequence 181. Application US/09281418

Patent No. 6287769

GENERAL INFORMATION:
TARRAZI INCORPATION:
TITLE OF INVENTION: Method of Amplifying DNA Fragment, Apparatus for Amplifying DNA FITLE OF INVENTION: method of Assaying Microorganisms, Method of Analyzing Mirrary Applicanton nisms and Method of Assaying Contaminant
TITLE OF INVENTION: member: US/09/281,418

TITLE OF INVENTION: misms and Method of Assaying Contaminant
FILE REFERENCE: 9982-7

CURRENT FILING DATE: 1990-03-30

EARLIER PEDLICATION NUMBER: UF/1999/69694

INFORMATION FOR SEQ ID NO: 21:
SEQUENCE CHARACTERISTICS:
LENGTH: 10 base pairs
TYPE: mucleic acid
STRANDEDMESS: double
STRANDEDMESS: double
TOPOLOGY: linear
MOLECULE TYPE: DA (genomic)
DESCRIPTION: p53 binding site
PUBLICATION INFORMATION:
AUTHORS: R1 Delity et al.
TITLE: "Human genomic DNA sequences define a
TITLE: Consensus binding site for p53"

SEREAL INFORMATION:
APPLICANT: Hohmann, Hans-Peter
APPLICANT: Huembelin, Markus
APPLICANT: CALLICAN LOON, Adolphus
APPLICANT: Schurter, Walter
ITILE OF INVENTION: Improved Riboflavin Prod
CURRENT APPLICATION NUMBER: US/08/899,241A
CURRENT FILING DATE: 1997-07-23
EARLIER APPLICATION NUMBER: 95111905.4
EARLIER PILING DATE: 1996-07-24
NUMBER OF SEQ ID NOS: 252
SOFTHARE: Patentin Ver. 2.0
SEQ ID NO 2-201
               TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)
DESCRIPTION: p53 binding site
PUBLICATION INFORMATION:
AUTHORS: El Deiry et al.
TITLE: "Human genomic DNA sequences define
TITLE: consensus binding site for p53"
VOLUME: 1

Patent No. 6538173

GENERAL INFORMATION:

APPLICANT: Heber-Katz, Ellen

TITLE OF INVENTION: Compositions and Methods for Wound

TITLE OF INVENTION: Healing

FILE REFERENCE: 00486.7862A

CURRENT APPLICATION NUMBER: US 60/074,737

PRIOR APPLICATION NUMBER: US 60/074,737

PRIOR APPLICATION NUMBER: US 60/097,937

PRIOR APPLICATION NUMBER: US 60/097,937

PRIOR APPLICATION NUMBER: US 60/102,051

PRIOR PRIOR DATE: 1998-09-28

NUMBER OF SEQ ID NOS: 346

SOFTWARE: PASESQ for Windows Version 4.0

LENGTH: 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-249-155A-177/C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CITY: Charlotte
STATE: No. 6025339th Carolina
CONTRY: USA
ZIP: 28234
COMPUTER: ENDABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IEM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/757,024
FILING DATE: 26-NOV-1996
TLANSIFICATION: 514
                                                                                                  COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
SOBTWARE: Batentin Release #1.0, Version #1.25
SOSTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/488,551B
FILING DATE: 10-78B-1994
APPLICATION NUMBER: PM0284 (AU)
FILING DATE: 21-78B-1994
APPLICATION NUMBER: PW0284 (AU)
FILING DATE: 21-78B-1995

VERNERAL INFORMATION:

APPLICANT: Mallet, Francois

APPLICANT: Guillou-Bonnici, Francoise

APPLICANT: Cleutain, Philippe

APPLICANT: Levasseur, Pierre

TITLE OF INVENTION: MODIFIED PROMOTER FOR RNA POLYMERASE.

TITLE OF INVENTION: HAS PERATION AND ITS APPLICATIONS

NUMBER OF SEQUENCES: 65

CORRESSOURCES: 65

CONTRY: Alexandria

STATE: VA

COUNTRY: USA

ZIPP: 2214

COMPUTER READABLE FORM:

MEDIUM TYPE: Flopyy disk

COMPUTER: DAP PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFFWARE: Parent In Release #1.0, Version #1.30

CURRENT APPLICATION NUMBER: US/08/360,051A

FILING DATE: 20-DEC-1994

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4, Application US/09380836
Batent No. 6551775
GENERAL INFORMATION:
APPLICANT: Lifton, Richard P.
APPLICANT: Lifton, Richard S.
TITLE OF INVENTION: Method to Diagnose and Treat Pathological Conditions
TITLE OF INVENTION: Resulting from Deficient Ion Transport such as
FITLE OF INVENTION: Applications of the Conditions
TITLE OF INVENTION: Resulting from Deficient Ion Transport such as
FITLE REPERENCE: 44574-5018-035
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gapa

AAT3329-30 are primers used to determine the absence of adenovirus Ela nucleotide sequences in an adenoviral (Adv) vector encoding for the captression of human wild-type p53 protein (Adw1p53). New Adenoviral (Adv) extors comprise: (i) an oxigin of replication; (ii) a left inverted terminal repeat; (iii) a nucleotide sequence of the Adv genome contg. Clai sites, one at the 5'-and; and (iv) a homologous recombination comain. Adv vectors which also contain heterologous DNA and regulatory sequences, are used to inhibit cell proliferation (including abnormal vascularisation), esp. to treat human melanoma, breast or lung tumours, are also used to treat human melanoma, breast or lung tumours carcoma and carcinoma, including forms resistant to drugs. The vectors are also used to treat subjects at risk of such cancers, and to purge are also used to treat subjects at risk of such cancers, and to purge the second (upstream) Clai site greatly reduces the chance of production of the second (upstream) Clai site greatly reduces the chance of producing Undingested DNA genome and increases the chance of generating fully cut DNA (i.e. redu. of parental genomic based vector; and infect breast
                                                                                                                                                                                                                                                                                          ö
                                    The present invention provides antisense compounds targetted to nucleic acid molecule encoding Ship-1 (also Known as SH2-containing phosphatidylinositol phosphatae-1 and INPPED) to modulate/Anhibit the expression of Ship-1. The invention is useful in treatment of diseases such as insensitivity to apoptotic signals, autoimmune disorders, developmental disorders and inflammatory disorders. The present sequence is human Ship-1 antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Adeno:viral vector for gene therapy of cancer or bone marrow purging contains two ClaI restriction sites to increase chance of generating fully cut DNA, thus reducing the parental genomic background.
                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a mechan (MI) for designing capture oligonucleotide probes (II) will hybridise with little mismatch, where oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus necformans, Candida ablacans and Aspergillus funigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Bar virus and polio virus, and parasitic infectious agents elected from Onchoverva volvulus, Entamoeba histolytica and Dracumculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA ampilification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food method is also used for environmental monitoring, forensics and the food electron microscope and infrared microscope) the support at the food particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compounds that limit the expression of human TRADD protein, useful in the treatment and diagnosis of cancer, inflammation and septic
                                                                                The invention relates to antisense compounds targetted to nucleic acid encoding RECQL2 (gene associated with Bloom's disorder) to inhibit the expression of RECQL2. Antisense compounds of the invention are useful for treating diseases associated with expression of RECQL2, in humans. They are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human RECQL2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The intracellular protein TRADD has been identified as a critical link between tumour necrosis factor (TNF) receptor binding and downstream activation of NF-kappa-B. Overexpression of native TRADD activates NF-Kappa-B in the absence of TNF and dominant negative mutants of TRADD block TNF-induced NF-kappa-B activation. A second effect of TNF in many cell types is the induction of apoptosis (programmed cell death). TRADD
with Bloom's disorder, for modulating RECQL2 expression and treating diseases e.g. tumors associated with expression of the RECQL2 in humans.
                                                                                                                                                                                                                                                                                                            Gaps

An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage is
overexpression has been shown to mimic TNP induction of apoptosis as are the rate limiting step of TTR action and would therefore serve as the most efficient targets for inhibition of TNF-induced events. Antisense oligonucleotides capable of inhibiting TNPD function may therefore be useful in a number of therepetic, diagnostic and research applications. Inhibiting expression of TRADD by contacting human cells or tissues with the antisense compound may be used to treat a disease or condition associated with TRADD expression, for example, septic shock, inflammation, or cancer. TRADD antisense oligonucleotides of varying finhibitory capabilities are listed in GENESEQ records AAZ93438-Z93517. The antisense oligonucleotides exhibit enhanced inhibitory capabilities when they have 2'-MOE wings and a deoxy gap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage, involves identifying polymorphisms in associated genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             low bone mineral density, BMD; bone damage; polymorphism; osteoporosis; single nucleotide polymorphism; SNP; PCR primer; ss; human.

to inhibit a proteinase activity, to modulate cell-cell interactions, haematopoiesis and the ability to modulate clotting. Polypeptide and properties and the ability to modulate clotting. Polypeptide and control of discrete characterised by their aberrant expression or activity. The discrete characterised by their aberrant expression or activity. The antibodies are useful as modulating agents in regulating a variety of callular processes e.g. cell proliferation and/or cell differentiation. TANGO-139 is useful in wound healing and for treating cancer, TANGO-110 is useful in wound healing and for treating cancer, TANGO-110 is useful for treating neoplasia, TANGO-17 or WDNM-2 is useful for treating cancer, are useful to treat pancreatid disorders, such as pancreatids. TANGO-125, 110, 175 molecules treat heart disorders, e.g., the brain. TANGO-125, 110 and 175 molecules are useful for treating cancer, are disorders, such as glomerular disease (e.g., acute and chronic glomerulonephritis), TANGO-175 is useful to treat uterine disorders, such as glomerular diseases eru uterine disorders, such as glomerular diseases and sorder. TANGO-175 is useful to treat uterine cylence, e.g., the fetal spleen, associated diseases and disorders, such as inflammatory disorders. TANGO-185, 125, 110, 175 or WDNM-2 are useful for treating proliferative disorders, such as inflammatory disorders. TANGO-185, systemic lupus erythematosus, insulin-dependent dispetes mellitus, immune related disorders, e.g., insulin-dependent dispetes mellitus, immune related disorders, e.g., insulin-dependent dispetes mellitus, immune related disorders, e.g., insulin-dependent disorders, org., insulin-dependent disorders and context and disorders, e.g., insulin-dependent disorders and Human; TANGO; kidney failure; hyperplasia; inflammatory disorder; cancer; angiogenesis; hematopoietic disorder; pancreatic disorder; bearcreatic disorder; bearcreatic disorder; testicular disorder; proliferative disorder; tumour; ovulation disorder; testicular disorder; lung disorder; Crohn's disease; prostate disorder; Mipple's disease; hemophiliser; vulnerary; vasotropic; psoriasis; leukaemia; gene therapy; tranquillizer; vulnerary; vasotropic; psoriasis; leukaemia; daundice; immunosuppressive; abortion; ischaemia; arthritis; allergy; Gaps ö 59.0%; Score 11.8; DB 1; Length 18; 86.7%; Pred. The invention relates to an isolated polypeptide termed human T139 (TANGO 139), T125, T110, musine T175, human T175 or musine NDMP-2 T139 is useful for treating kidney defects such as kidney failure or hyperplasis useful for treating wound healing and cancer, T110 is useful for treating explanata, inappropriate andiogenesis or tissue regeneration and hammare trains neoplasis. T125 and 110 are useful to treat pancreatid chaematopoietic disorders. T125 and 110 are useful to treat pancreatid disorders such as pancreatidis, diabetes mellitus, and Zollinger-Ellison sinceres placental disorders such as placentitis or abortion and disorders of the brain such as retering and control in such as cerebral edema, cerebrovascular disease and tumours and injury or tramma to the brain. T125, 110, 175 molecules of the brain such as mecular y disorders such as receptal and disorders such as mecular disorders such as required to some such as mecular disorders including jaundice, hepatic fallure, Crigler-Naijar syndromes or including jaundice, hepatic janud 175 seventerion and ovarian disorders such as glomerular disorders including content and falsorders such as glomerular disorders, hypothasia of the endometrium, uterine cancer, bone marrow, blood and haematopoid et or disorders such as disorders such as originated diseases and disorders end, sorders such as originated and the falsor such as originated and sorder such as originated and sorder such as ori

Adaptor directed primer Hnd.pr.4. (first entry) 27-JAN-1997

AAT27875;

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect opd. simple sequence repeat, and an adaptor segment. The present sequence is expensed to an adaptor segment. The present sequence is an example of an ADP, which spans the length of, and is complementary to, one strand of a double stranded adaptor that is ligated into the restriction endouclease digested target DNA. It therefore covers all or part of the restriction site, and its 3 end can carry arbitrary, non-degenerate bases that anneal to, and prime from nucleotides within the target DNA fragment adjacent to the adaptor. The method represents a modified amplified fragment length polymorphism assay, which is partic, useful for genome fingerprinting, i.e. for

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 claim be used an gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phonotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodiaes that specifically recognise hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence date for this patent did not form part of the printed specificalion, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rank DR,

Shannon ME; Chen W, Hanzel DK, Rank DR, Gu Y, Ji Y, Penn SG, New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 9914; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 clambe used as probes to detect, characterise and quantify nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phonotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be protein variants having desired phonotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule add/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically recognise hGDMLP-1 and/or amount specifically recognise hGDMLP-1 capture probes for surface-enhanced laser describing in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hospital muscle dates for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pct_sequence

Determining the p53 status of a sample, useful for assaying for mimetics or antagonists of p53, or for the presence of DNA damage, comprises determining whether p53 binds to the pGL3 vector in a sample containing a pGL3 vector.

Disclosure; Page 12; 53pp; English.

The patent discloses methods for determining the p53 status of a sample which comprise providing a sample containing a pGL3 luciferase reporter vector and determining whether p53 binds to the pGL3 uciferase reporter transcription factor that regulates many genes including those associated with cell cycle control, apoptosis and DNA damage repair. pGL3 reporter vectors contain a modified firefly luciferase cDNA designated luci, p53 protein binds to pGL3-basic vector and causes luciferase expression. The method is useful for determining the p53 status of a sample. It is also useful for assaying for minetics or antagonists of p53 and for assaying for presence of activated p53 and/or DNA damage. The invention also relates to a method of modifying pGL3 vector which involves deletion or alteration of a CCGGGG motif of the pGL3 vector and/or caleting or alteration of a CCGGGG motif of the pGL3 vector and/or deleting or alteration as sequence within 20 bp sequence 5 or 3 of CCGGG motif. The nucleic acid having a sequence incorporating the CCGGG motif is useful for conferring promoter activity or p53-responsiveness on a nucleic acid activity. The present DNA sequence is mouse p21MAFI CCGGGG motif is conferred to the present DNA sequence is mouse p21MAFI CCGGGG motif to confer promoter activity. This sequence is used along with CCGGG motif to confer flanking DNA. Thi promoter activity RESULT 12

Novel Chlamydia pneumoniae protein useful in the manufacture of a medicament for treatment or prevention of infection due to Chlamydia, preferably Chlamydia pneumoniae, and for diagnostic purposes.

Example, Page 33, 364pp; English

Dequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as therosclerosis, coronary artery disease, carcoid artery stenosis, coronary artery disease, acroid artery stenosis, myocardial infarction, cerebrovascular disease, acrtic aneurysm, cliantocation and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the proteins and mucleic acids of the invention prevention or treatment of chlamydial infections, particularly Chlamydia prevention or treatment of chlamydial infections, particularly Chlamydia (Chlamydia pneumoniae, and the notleic acids may also be used in the defection of Chlamydia pneumoniae, and the notleic acids may be used in the Sequences of Sequences ABL91182-ABL91657 represent PCR pneumoniae gene expression of sequences ABL91182-ABL91657 represent PCR primer tail sequences containing restriction enzyme sites used in the exemplifications in the amplification of the novel Chlamydia pneumoniae containing restriction enzyme sites used in the exemplifications in the amplification of the novel Chlamydia pneumoniae

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                      colon cancer; colorectal cancer; pancreatic cancer; SAGE tag; analysis of gene expression; diagnostic; prognostic; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lambda vector; cloning system; homologous recombination; eukaryote; embryonal stem cell; adaptor; ds.

The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX10947-31815. The methods of the invention can be used in the diagnosis, prognosis and

The present invention describes a cloning system useful for homologous recombination in eukaryotic cells and consisting of a vector-adaptor system with a lambda vector and 4 adaptor nucleotides. This can be used to alter the genome of eukaryotic cells, particularly embryonal stem cells, at a desired location. The present sequence is an adaptor sequence used in the construction of the lambda vector of the invention AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular Cloning system for homologous recombination, useful for introducing mutations into eukaryotic genomes at selected sites, comprises lambda Polymorphism, biallelic, human, forensic, paternity testing, disease, detection, phenotypic typing, characteristic, infection, hereditary, autoimmune disease, cancer, inflammation, drug, therapy, medicament, treatment, marker, primer, ss. New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease. The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBD3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, seroconin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, plantis, serborhoea, keloids, keratosis, neoplasis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, hard nor skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Solute carrier family 6 neurotransmiter transporter; seotonin 4; SLC6A4; genotyping; allele specific oligonucleotide; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, ambezzymes, as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, ambezzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and apteners that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV general modulate the expression and/or replication of HCV. The compounds that modulate the expression and/or replication of HCV. The compounds compounds and methods of the invention are useful for the treatment of degenerative and methods of the invention are useful for the treatment of degenerative and expression such as cirrhosis, liver failure, and hepatocellular expressions. The present sequence represents a target for one of the anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, incaymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; harmerhead tibozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; anti-HV; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
